ISPmail tutorial for Debian Lenny
Send a test mail using Telnet
Emulating an SMTP session with Telnet
Let us try to send an email to the user ow. As the "example com" domain does not really existing your DNS settings will likely not point to the right server. So we are simulating an SMTP session with the felnet command. Install the telnet package if you haven't always.
Then establish a TCP connection to the SMTP port:
      S> telnet localhost smtp
The server should reply:
      Trying 127.0.0.1...
Connected to localhost.
Escape character is '^]'.
220 mailtest ESMTP Postfix (Debian/GNU)
Great. Postfix is listening and wants us to speak SMTP. First we need to be friendly
      ehlo example.com
Postfix appreciates our friendliness and tells us which features it provides
      250-my-new-mailserver
250-PIPELINING
250-SIZE 10240000
250-VEFY
250-ETRN
250-ETRN
250-ETRN
250-BITMIME
250 BITMIME
250 BS DSN
Hey, Postfix, we have a mail from steve@example.com
      mail from:<steve@example.com>
Looks like Postfix is happy with that because return codes that start with a '2' are good news
     rcpt to:<john@example.com>
Postfix accepts that:
Postfix agrees and tells us we can send the actual mail now and end our input with a dot on an empty line:
        just wanted to drop you a note.
Postfix tells us it has received the mail and queued under a queue ID:
      250 2.0.0 Ok: queued as A9D64379C4
Thanks, Postfix, we are done:
Checking the logs
 Take a look at the /var/log/mail.log file now. You should see something similar to:
      postfix/smtpd[...]: connect from localhost[127.0.0.1]
postfix/smtpd[...]: sFF712A6: Client=localhost[127.0.0.1]
postfix/clenupl...]: sFF712A6: message=idex...
postfix/qmgr[...]: SFF712A6: from=<stereplocample.com>, size=384, nrcpt=1 (queue active)
postfix/qmgr[...]: SFF712A6: rom=<stereplocample.com>, relay=dowecot, ..., status=sent (delivered via dowecot service)
postfix/qmgr[...]: SFF712A6: removed
postfix/qmgr[...]: disconnect from localhost[127.0.0.1]
 The delivery has worked. Postfix has correctly determined that the destination domain is a virtual domain and forwarded the email to the 'dovecot' service.
Checking the user's mailbox
The email should now be somewhere under /var/vmail/example.com/john. Let us take a look:
       $> cd /var/vmail/example.com/john/Maildir
$> find
        . ./cur ./new ./new/1179521979.V801I2bbf7M15352.mailtest ./tmp
The new email is shown:
     q:Quit d:Del u:Undel s:Save m:Mail r:Reply g:Group ?:Help 1 N May 18 steve@example.c (0.1K)
Press ENTER to read the email:
      From: steve@example.com
To: undisclosed-recipients:
      just wanted to drop you a note.
So the email arrived at John's account. Perfect. Choose 'q' twice to exit mutt again.

Sut	uble check your milted by Christoph Haas on <u>Sun, 98/99/2009 - 18:93</u>
Do	uble check your /etc/postfix/master.cf - sounds like your "dovecot" entry is broken.
	Danke, das war der erste Submitted by Anonymous on <u>Sun, 08/09/2009 - 19:15</u>
	Danke, das war der erste Fehler ;)
	ich hatte nur ein } vergessen
	Ok, jetzt steht im Log:
	Aug 9 19:09:20 mail dovecot: auth-worker(default): sql(postmaster@domain.de): User query failed: Table 'mailserver.users' doesn't exist
	Intaliserver users duesn't exist. Ich habe alles nochmal durchgeschaut, kann aber in keiner Datei den Fehler finden, vielleicht brauche ich noch
	nen Kaffee :P
	Stephan
	Läuft alles Submitted by Anonymous on Mon. 08/10/2009 - 06:19
	Moin,
	ok, alles noch mal von vorne und jetzt läuft es Fehlerfrei, vielen Dank für das hervorragende Tutorial!
	Gruß Stephan
anno	nt telinet to smtp ed by Anonymous on <u>Fri, 08/28/2009 - 22:13</u>
lello!	
m tryi	ng to telnet to localhost smtp but it refuses me saying:
rying	127.0.0.1 "1
elnet:	Unable to connect to remote host: Connection refused
	ea why is it doing this?
S: It	can connect to http.

	by the way when i create an alias and forward that account to my gmail, i can see that all the mails are sent successfully.
	and in dovecot-deliver.log there are the "error: userdb lookup: connectf/var/run/dovecot/auth-master) failed: no such file or directory"
	messages.
	thanks again
	auth-master
	Submitted by Anonymous on <u>Sun</u> , 02/13/2011 - 12:37 I had such problem, and I didn't find any information about "auth-master" socket
	My mail log was pretly clear, but there were several repeating ".Error. Can't connect to auth server at Narriundivoecolizatin matter. No such file or directory" in the relatiosvecotionecotiog, it was lasting several days while I was searching about this issue. Finally I found one old entry in divoecotiog. "Error subtlifesfaulty invest. Missing value in connect string: host," I rechecked my /etc/dovecot/dovecot-sql.conf and there was one extra space in connection string, "connect = host =127.0.0.1" instead of "connect = host =127.0.0.1"

	Will u please help?
	Provider restrictions?
	Submitted by Christoph Haas on Wed, 02/24/2010 - 20:46
	Could it be that your internet provider does not allow SMTP connections from their clients? That a pretty
	common problem. Check whether "telnet mx.workaround.org 25" goes through. If it doesn't then chances are
	that your ISP is very restrictive. Check with them how you are supposed to send out emails. They probably offer a relay server that you can set as "relayhost" in your main.cf.
	I am unable to telnet on
	Submitted by Anonymous on Fri, 02/26/2010 - 16:25
	I am unable to telnet on mx.workaround.org , but i called up my ISP
	and asked they said we already unlocked your 25 port. You can check telnet smtp.gmail.com 465.
	now can u please resolve this?
	4057
	465? Submitted by Christoph Haas on <u>Sun, 02/28/2010 - 11:58</u>
	465 is the TCP port for secure (SSL) SMTP. What about port 25° Can you "telnet mx.workaround.org 25° if now complain to your ISP again. The error is not in your configuration.

	ox for steve created? ted by Anonymous on <u>Sat. 02/27/2010 - 23:27</u>
I tried	the test, everything went fine.
	neres always a but)
	or devnull@workaround.org is bounced for some reason (rdns is wrong) and now dovecot (?) creates a maildir for @example.com.
	saliserver probably thinks he is responsible for example.com but i don't get why he is creating a maildir for a (not in xx maps) non existent user.
Is this as dor	expected behavior? In this case i belive bounced mail with an (non existent) mail from (with a virtual_alias_domain part) is delivered to a new maildir.
	om external can't be send to steve@example.com, but a bounce because of an alias does (if the sender was @example.com)
0	ş;-
	rtual_mailbox_maps? britted by Christoph Hass on <u>Sun. 92/28/2019 - 11:55</u>
If I	Dovecot creates mailboxes for random non-existing users then I could imagine your virtual_mailbox_maps settings incorrect. Check it: "postconf virtual_mailbox_maps"
	# postconf
	Submitted by Anonymous on Mon. 03/01/2010 - 09:40
	# postconf virtual_mailbox_maps virtual_mailbox_maps = mysql:/etc/postfix/mysql-virtual-mailbox-maps.cf
	# cat /etc/postfix/mysql-virtual-mailbox-maps.cf user = mailuser
	password = PASS hosts = 127.0.0.1
	dbname = DB query = SELECT 1 FROM virtual_users WHERE email="%s'
	It does not creat-le random accounts, but only in the described example: an destination recipient that is configured for an alias bounced AND the sender has the domainpart of the server but is non existent
	Can you try:
	 Setup an Alias, with an external traget that is non existent and will bounce (actually something that rejects with a 5XX when trying to deliver)
	- telnet to your mailserver
	ehlo server
	mail from: <nonexistentuser@mailserver></nonexistentuser@mailserver>
	rcpt to: <aliasuserwith bouncing="" destination=""></aliasuserwith>
	data
	test
	Some logities from me (using just the entries of your howto, spammer is no local user, but gets created a maildir after bounce):

mail.I Submit	og unknown user ted by Anonymous on <u>Mon. 03/29/2010 - 20:11</u>
Hi the	rel
	t I have to say: great work. Thank you!
	44 II
At first But at domai	this point I'm getting an error. n postfwl/coal(\$481]: CA58B30321: to= <username@domain.org>, relay=local, delay=0.03, delays=0.01/0/0/0.02, 1.1.1, status=bounced (unknown user: "username")</username@domain.org>
At first But at domain dsn=5 After of SELEC	n postfix/local[2481]: CA5BB30321: to= <username@domain.org>, relay=local, delay=0.03, delays=0.01/0/0/0.02,</username@domain.org>

	ay=local? mitted by Anonymous on Wed, 03/31/2010 - 00:17
Do	vecot won't even get your email. The "relay=local" part of the logfile shows that the domain "domain.org" was
	sidered to be a local domain. You surely wanted it to be a virtual domai. Check your mydestination setting.
	Thanks
	Submitted by Anonymous on Wed, 03/31/2010 - 18:23
	Thanks for the reply!
	"mydestination" included "domain.org". Removing it solved the problem and dovecot is now used as relay. Thank you!
	you
	hates me ed by Anonymous on <u>Frl. 04/09/2010 - 07:29</u>
Up uni	It his point everything has been working fine
The fir	st time I tried to telnet, it would say something like:
Conne	127.0.0.1 tetata to localinost. character is "ij"
220 mi	Collaboration 5 **] Illibest ESMTP Sendmail 8.01 and so on IHANCEDSTATUSCODES
	at was it. Then I restarted and now all I get is:
	127.0.0.1
Conne Escape	cted to localhost.
and the	at is all I get not sure what is happening.
	teinet hates me milted by Anonymous on Fri, 04/09/2010 - 15:21
nk	maybe it doesn't. I uninstalled and then reinstalled postfix and now it works thank you for your patience. Great
Ho	w To by the way
