# Setup Local Mail Server Using Postfix, Dovecot And Squirrelmail On OpenSUSE 13.x

by M.eI Khamlichi

Share this Article: [f](#) 0 [g+](#) 0 [t](#) 14 [in](#) 1 [r](#) 0 [j](#) 2

[Postfix](#) is a free open source mail transfer agent (MTA). It is easy to administer, fast and as well as the secure MTA. It's an alternative to Sendmail, which is the default MTA for RHEL.

Well, let us see how to setup a basic local mail server using Postfix, Dovecot and Squirrelmail On Opensuse, although it should work on SLES Servers.

If you want to setup mail server on RHEL based distros, follow the below article.

- [Setup Mail server On CentOS 6.x](#)

In Opensuse, it is quit different, because the commands and the folders destinations are not the same like Fedora/Centos.

For this tutorial, I use Opensuse 13.1 bit minimal installation, **with Apparmor disabled**. My test box details are given below.

```
OS : openSUSE 13.1 "Bottle"
IP Address : 10.1.1.174
Hostname: opensuse.unixmen.com
```

## Prerequisites

1. Remove default MTA sendmail first if it's already installed. Sendmail will not be installed by default in minimal installation, so you can ehlokip this step.

```
# zypper remove sendmail
```

2. Setup DNS server and add the Mail server MX records in the forward and reverse zone files. To install and configure DNS server, navigate to this [link](#). And you'll need to contact your ISP to point your external static IP to your mail domain.

3. Add hostname entries in /etc/hosts file as shown below:

```
# vi /etc/hosts

127.0.0.1    localhost localhost.localdomain localhost4 localhost4.localdomain4
::1        localhost localhost.localdomain localhost6 localhost6.localdomain6
10.1.1.174  opensuse.unixmen.com  opensuse unixmen.local
```

## Install Postfix

Let us install postfix package using the command:

```
# zypper in postfix
```

## Configuring Postfix

Edit /etc/postfix/main.cf,

```
# vi /etc/postfix/main.cf
```

find and edit the following lines:

```
## Line no 677 - Uncomment and set your mail server FQDN ##
myhostname = server.unixmen.local

## Line 91 - Uncomment and Set domain name ##
mydomain = unixmen.local

## Line 107 - Uncomment ##
myorigin = $mydomain

## Line 121 - Set ipv4 ##
inet_interfaces = all

## Line 665 - Change to all ##
inet_protocols = all

## Line 676 - Uncomment ##\
mydestination = $myhostname, localhost.$mydomain, localhost, $mydomain

## Line 268 - Uncomment and add IP range ##
mynetworks = 192.168.1.0/24, 10.1.1.0/24, 127.0.0.0/8

## Line 423 - Uncomment ##
home_mailbox = Maildir/
```

Save and exit the file. Start/restart Postfix service now:

```
# service postfix restart
# chkconfig postfix on
```

Testing Postfix mail server

First, create a test user called "mel".

```
# useradd mel
# passwd mel
```

Access the server via Telnet and enter the commands manually shown in red colored text.

```
# telnet localhost smtp

opensuse:~ # telnet localhost smtp
Trying ::1...
```

```
Connected to localhost.
Escape character is '^j'.
220 opensuse.unixmen.com ESMTP
ehlo localhost
250-opensuse.unixmen.com
250-PIPELINING
250-SIZE
250-ETRN
250-ENHANCEDSTATUSCODES
250-8BITM
mail from:<mel>      ## Type this - mail sender address##
250 2.1.0 Ok
rcpt to:<mel>       ## Type this - mail receiver address ##
250 2.1.5 Ok
data      ## Type this to input email message ##
354 End data with
welcome to unixmen mail server      ## Enter the boddy of the email ##.
      ## type dot (.) to complete message ##
250 2.0.0 Ok: queued as 3AB0E233B7
quit      ## type this to quit from mail ##
221 2.0.0 Bye
Connection closed by foreign host.
```

Now navigate to the user "mel" mail directory and check for the new mail:

```
# ls /home/mel/Maildir/new/
```

Sample output:

```
opensuse:~ # ls /home/mel/Maildir/new/
1399304353.V802I3257M677135.opensuse.unixmen.local
```

A new mail is received to the user "sk". To read the mail, enter the following command:

```
# cat /home/mel/Maildir/new/1399304353.V802I3257M677135.opensuse.unixmen.local
```

Sample output:

```
Return-Path: <mel@unixmen.local>
X-Original-To: mel
Delivered-To: mel@unixmen.local
Received: from localhost (localhost [IPv6:::1])
        by opensuse.unixmen.com (Postfix) with ESMTP id 3AB0E233B7
        for <mel>; Mon,  5 May 2014 17:38:11 +0200 (CEST)
Message-Id: <20140505153831.3AB0E233B7@opensuse.unixmen.com>
Date: Mon,  5 May 2014 17:38:11 +0200 (CEST)
From: mel@unixmen.local
```

```
Mel from Unixmen team
```

## Installing Dovecot

Dovecot is an open source IMAP and POP3 mail server for Unix/Linux systems. To install:

```
# zypper in dovecot
The following NEW packages are going to be installed:
  dovecot21 dovecot21-backend-mysql dovecot21-backend-pgsql dovecot21-backend-sqlite libpq5
```

## Configuring Dovecot

Edit the file /etc/dovecot/dovecot.conf file,

```
# vi /etc/dovecot/dovecot.conf
```

Uncomment the following line:

```
## Line 20 - uncomment ##
protocols = imap pop3 lmtp
```

Edit file /etc/dovecot/conf.d/10-mail.conf file

```
# vi /etc/dovecot/conf.d/10-mail.conf
```

Make the changes as shown below:

```
## Line 24 - uncomment ##
mail_location = maildir:~/Maildir
```

Edit /etc/dovecot/conf.d/10-auth.conf

```
# vi /etc/dovecot/conf.d/10-auth.conf
```

And make the changes as shown below:

```
## line 9 - uncomment##
disable_plaintext_auth = yes

## Line 99 - Add a letter "login" ##
auth_mechanisms = plain login
```

Edit file /etc/dovecot/conf.d/10-master.conf,

```
# vi /etc/dovecot/conf.d/10-master.conf
```

Make changes as shown below:

```
## Line 91, 92 - Uncomment and add "postfix"
#mode = 0600
  user = postfix
  group = postfix
```

Start Dovecot service:

```
# service dovecot start
# chkconfig dovecot on
ln -s '/usr/lib/systemd/system/dovecot.service' '/etc/systemd/system/multi-user.target.wants/dovecot.service'
```

## Testing Dovecot

It's time to test Dovecot configuration. Enter the following command in Terminal:

```
# telnet localhost pop3
```

if you get issues to connect to pop3, please stop the Apparmor firewall.

```
/etc/init.d/boot.apparmor stop
```

Enter the commands manually marked in red color:

```
telnet localhost pop3
Trying ::1...
Connected to localhost.
Escape character is '^]'.
+OK Dovecot ready.
user mel
+OK
pass 000000
+OK Logged in.
retr 1
+OK 407 octets
Return-Path: <mel@unixmen.local>
X-Original-To: mel
Delivered-To: mel@unixmen.local
Received: from localhost (localhost [IPv6:::1])
  by opensuse.unixmen.com (Postfix) with ESMTTP id 3AB0E233B7
  for <mel>; Mon, 5 May 2014 17:38:11 +0200 (CEST)
Message-Id: <20140505153831.3AB0E233B7@opensuse.unixmen.com>
Date: Mon, 5 May 2014 17:38:11 +0200 (CEST)
From: mel@unixmen.local

Mel from Unixmen team
.

quit
+OK Logging out.
Connection closed by foreign host.
```

As you see in the above, Dovecot is working!

Working with mail in command modes little bit difficult for us. So we will install a webmail client called [Squirrelmail](#) to send/receive emails via a web browser.

## Installing Squirrelmail

Make sure that you've installed and enabled Squirrelmail repository. Now install Squirrelmail using the following command:

```
zypper addrepo http://download.opensuse.org/repositories/server:php:applications/openSUSE_13.1/server:php:applications.repo
zypper refresh
```

```
# zypper in squirrelmail
```

## Configuring Squirrelmail

Navigate to `/srv/www/htdocs/squirrelmail/config` directory and run the command `conf.pl`:

```
# cd /srv/www/htdocs/squirrelmail/config
# ./conf.pl
```

The following wizard will open. Enter choice "1" to set your organization details:

```
SquirrelMail Configuration : Read: config.php (1.4.0)
-----
Main Menu --
1.  Organization Preferences
2.  Server Settings
3.  Folder Defaults
4.  General Options
5.  Themes
6.  Address Books
7.  Message of the Day (MOTD)
8.  Plugins
9.  Database
10. Languages

D.  Set pre-defined settings for specific IMAP servers

C  Turn color off
S  Save data
Q  Quit

Command >> 1
```

The following wizard will open. Enter "1" again to modify your organization details:

```
SquirrelMail Configuration : Read: config.php (1.4.0)
-----
Organization Preferences
1.  Organization Name      : SquirrelMail
2.  Organization Logo      : ../images/sm_logo.png
3.  Org. Logo Width/Height : (308/111)
4.  Organization Title     : SquirrelMail $version
5.  Signout Page           :
6.  Top Frame              : _top
7.  Provider link         : http://squirrelmail.org/
8.  Provider name         : SquirrelMail

R  Return to Main Menu
C  Turn color off
S  Save data
Q  Quit

Command >> 1
```

### Set your Organization name and press Enter:

We have tried to make the name SquirrelMail as transparent as possible. If you set up an organization name, most places where SquirrelMail would take credit will be credited to your organization.

If your Organization Name includes a '\$', please precede it with a \. Other '\$' will be considered the beginning of a variable that must be defined before the `$org_name` is printed. `$version`, for example, is included by default, and will print the string representing the current SquirrelMail version.

```
[SquirrelMail]: Unixmen
```

By this way, setup all the details such as organization title, logo, provider name in the above wizard. Once you done, press "S" to save changes and press "R" to return back to your main menu:

```
SquirrelMail Configuration : Read: config.php (1.4.0)
-----
Organization Preferences
1.  Organization Name      : Unixmen
2.  Organization Logo      : ../images/sm_logo.png
3.  Org. Logo Width/Height : (308/111)
4.  Organization Title     : SquirrelMail $version
5.  Signout Page           :
6.  Top Frame              : _top
7.  Provider link         : http://squirrelmail.org/
8.  Provider name         : Unixmen Mail
```

```
R Return to Main Menu
C Turn color off
S Save data
Q Quit
```

Command >> s

Now enter "2" to setup mail Server settings such as domain name and mail agent etc.:

```
SquirrelMail Configuration : Read: config.php (1.4.0)
-----
```

```
Main Menu --
1. Organization Preferences
2. Server Settings
3. Folder Defaults
4. General Options
5. Themes
6. Address Books
7. Message of the Day (MOTD)
8. Plugins
9. Database
10. Languages
```

D. Set pre-defined settings for specific IMAP servers

```
C Turn color off
S Save data
Q Quit
```

Command >> 2

Enter "1", Enter your mail domain (ex. unixmen.local) and press Enter key.

```
SquirrelMail Configuration : Read: config.php (1.4.0)
-----
```

```
Server Settings
```

```
General
```

```
-----
1. Domain : localhost
2. Invert Time : false
3. Sendmail or SMTP : Sendmail
```

```
A. Update IMAP Settings : localhost:143 (uw)
B. Change Sendmail Config : /usr/sbin/sendmail
```

```
R Return to Main Menu
C Turn color off
S Save data
Q Quit
```

Command >> 1

The domain name is the suffix at the end of all email addresses. If for example, your email address is jdoe@example.com, then your domain would be example.com.

```
[localhost]: unixmen.local
```

Enter "3" and change from sendmail to Postfix MTA (i.e. SMTP):

```
SquirrelMail Configuration : Read: config.php (1.4.0)
-----
```

```
Server Settings
```

```
General
```

```
-----
1. Domain : unixmen.local
2. Invert Time : false
3. Sendmail or SMTP : Sendmail
```

```
A. Update IMAP Settings : localhost:143 (uw)
B. Change Sendmail Config : /usr/sbin/sendmail
```

```
R Return to Main Menu
C Turn color off
S Save data
Q Quit
```

Command >> 3

Enter "2" to switch from sendmail MTA to postfix.

You now need to choose the method that you will use for sending messages in SquirrelMail. You can either connect to an SMTP server or use sendmail directly.3

```
1. Sendmail
2. SMTP
Your choice [1/2] [1]: 2
```

Now enter "S" followed by "Q" to save and exit Squirrelmail configuration.

Create a squirrelmail vhost in apache config file:

```
# vi /etc/apache2/httpd.conf
```

Add the following lines at the end:

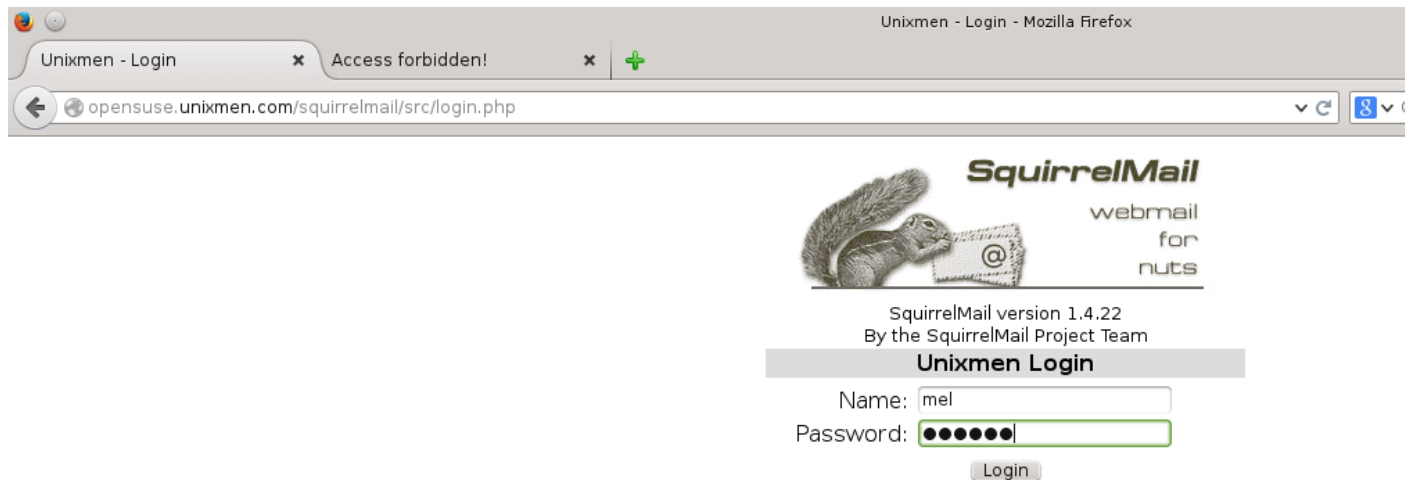

```
Alias /squirrelmail /srv/www/htdocs/squirrelmail
<Directory /srv/www/htdocs/squirrelmail>
  Options Indexes FollowSymLinks
  RewriteEngine On
  AllowOverride All
  DirectoryIndex index.php
  Order allow,deny
  Allow from all
</Directory>
```

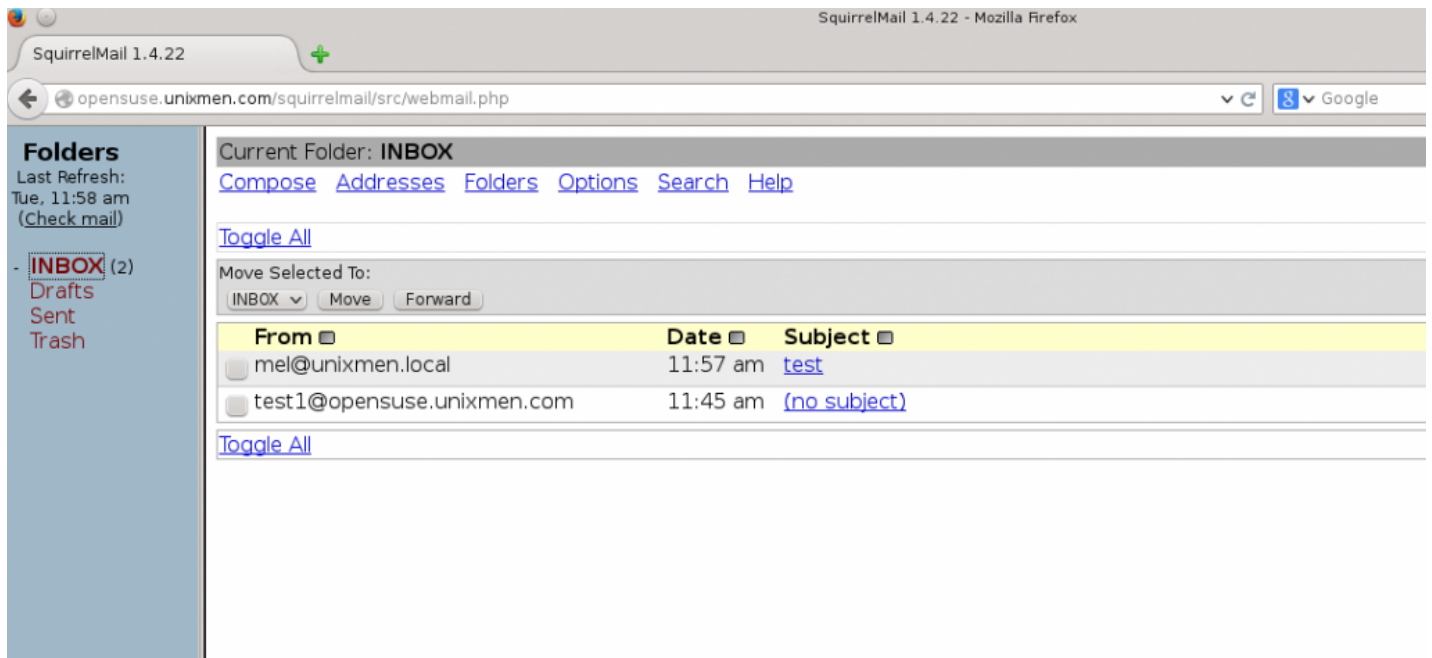

Restart the Apache service:

```
# a2enmod rewrite
# /etc/init.d/apache2 restart
```

## Access Webmail

Now navigate to <http://ip-address/squirrelmail> or <http://domain-name/squirrelmail> from your browser. The following screen should appear. Enter the username and password of the user.

## Create users

Create some users for testing. In my case i create two users called "test1" and "test2" respectively.

```
# useradd test1
# useradd test2
# passwd test1
# passwd test2
```

Sending emails from one account to another is tested under my machine and its working like a charm.

Cheers!

Way cool! Some very valid points! I appreciate you. penning this article plus the rest of the website is really good. Thanks for your insight! I have tried the Dedicated Server in Australia and having a Dedicated Hosting really is beneficial.
